

Quick installation and easy operation in IP networks.

The IP-PBX techniques for telephony combined to SIP (VoIP) and POE allows to define new audio system architecture in LAN environments. The communication between devices becomes easy and brings a lot of applications where control and management are quick to implement. Moreover, the systems are opened and can offer many functionalities with the same hardware. This example shows a connection diagram which may works as well a paging as an intercom system. Just by replacing or adding new SIP (VoIP) and POE devices to the network one can easily upgrade or re-dimension any installation.
